# What the numbers on this page mean

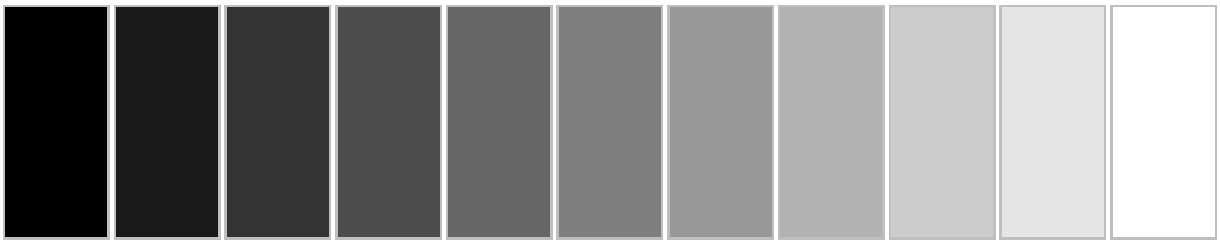

A file states the device it was prepared for, and the profile of that device travels inside it. Nothing else in the file says what its colours are: the numbers alone say none.

## The output intent this file carries

| | |
|---|---|
| Condition | sRGB |
| Description | sRGB IEC61966-2.1 |
| Profile | 6656 bytes, describing red, green and blue |
| Device | a screen |
| Claim | PDF/A-3B, which makes stating one compulsory |

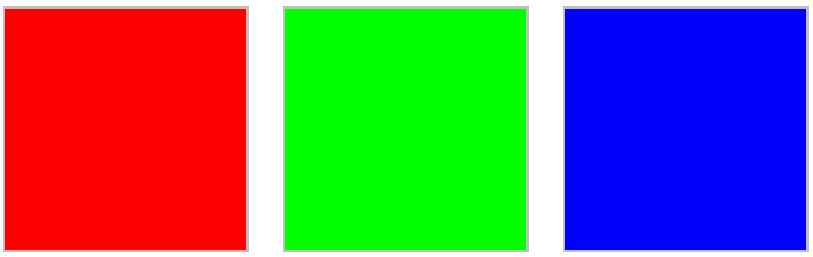

## The same profile, painted through

One profile does both jobs: it says what the file is for, and it is what these swatches are painted in. The file carries it once.

0% 10% 20% 30% 40% 50% 60% 70% 80% 90% 100%

## One channel at a time, at full strength

Red Green Blue

Hand a press profile on the command line and the page is drawn in its inks instead, under its own condition. A file that paints in CMYK and states a screen is a file a validator refuses.
